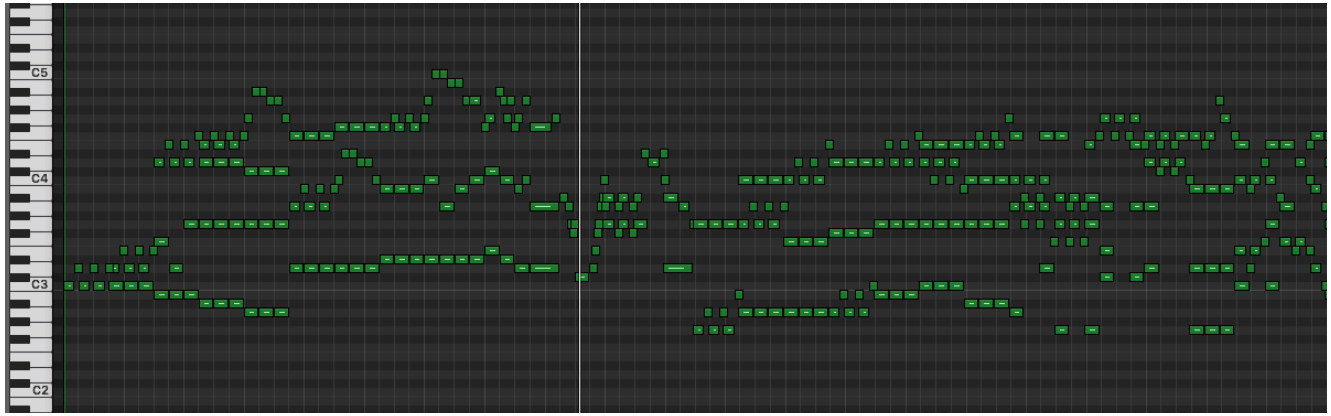
BachProp

Music is a complex temporal sequence

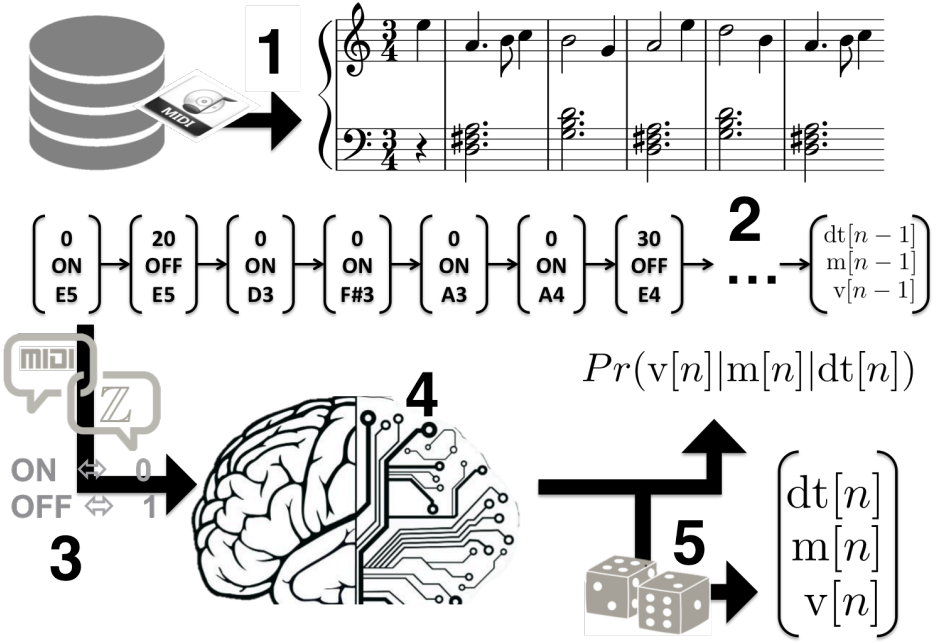
- Many temporal relationships governed by rules (stylistic, general, personal, …)



- BachProp is a probabilistic model that aims at capturing the temporal relationship between notes in specified music corpora

Outline

- Introduction
- Datasets
- From MIDI to BachProp
- Model architecture
- Training
- Generation
- Evaluation
- Discussion



Datasets | What's out there?

- Irish Folk
  - 45'000 Monophonic repetitive music on well defined scales
- Bach
  - 655 pieces from harmonized chorales, sonatas, concertos, …
  - Complex music with counterpoint (melodies that develop in parallel)
- Nottingham
  - 1037 Folk song (monophonic melody on simple chords)
- String quartets
  - 470 movements from Haydn, Mozart, Beethoven, Brahms, Dvorak and Schubert string quartets
- PianoMuscinelli
  - Collection of 25'000 piano music gathered on internet.
  - Heterogeneous

From MIDI to BachProp | MIDI

- MIDI is a standard notation for (symbolic) music
- MIDI is event-based

  {‘dt’: 120, ‘m’: ‘Note ON’, ‘value’: 55, ‘velocity’: 90)

  {‘dt’: 120, ‘m’: ‘Note OFF’, ‘value’: 55, ‘velocity’: 0)

  = {‘dt’: 120, ‘m’: ‘Note ON’, ‘value’: 55, ‘velocity’: 0)
- MIDI Metaparameter
  - Pulse Per Quarter note PPQ defines the duration of a quarter note.
  - Beats Per Minute PPM defines the tempo.

```
midi.Track(\
 [midi.ProgramChangeEvent(tick=0, channel=0, data=[0]),
  midi.NoteOnEvent(tick=0, channel=0, data=[60, 90]),
  midi.NoteOnEvent(tick=0, channel=0, data=[79, 90]),
  midi.NoteOnEvent(tick=0, channel=0, data=[84, 90]),
  midi.NoteOnEvent(tick=0, channel=0, data=[88, 90]),
  midi.NoteOffEvent(tick=120, channel=0, data=[60, 0]),
  midi.NoteOnEvent(tick=0, channel=0, data=[72, 90]),
  midi.NoteOffEvent(tick=120, channel=0, data=[72, 0]),
  midi.NoteOffEvent(tick=0, channel=0, data=[84, 0]),

From MIDI to BachProp | Summary

- Gather a big (homogenous) chorpus of MIDI file
- Construct the dictionaries
  - Constrain rhythm on a finite set of possible duration (21)
  - Constrain pitch on the range from lowest to highest note in the dataset
- For each song in the dataset
  - Extract from MIDI file, the sequence of events defined as (dT[n], T[n], P[n])
    - Convert to type 0 (single track)
    - Order chords
    - Use PPQ to translate tick durations to quarter note lengths
    - Map the duration to the dictionary entries
  - Use the dictionaries to map durations and pitches to unique integers
    - The resulting sequences are in the typical form of ANNs input data (before one-hot encoding)

Modeling note sequence with RNNs | BachProp

$$Pr(\mathbf{note}_s[1:N_s]) = Pr(\mathbf{note}_s[1]) \prod_{n=1}^{N_s-1} Pr(\mathbf{note}_s[n+1]|\mathbf{note}_s[1:n])$$

- RNNs approximate the transition probability as

$$\mathbf{y}[n] = \Phi(\mathbf{note}[n], \mathbf{H}[n]) \approx Pr(\mathbf{note}[n+1]|\mathbf{note}[1:n])$$

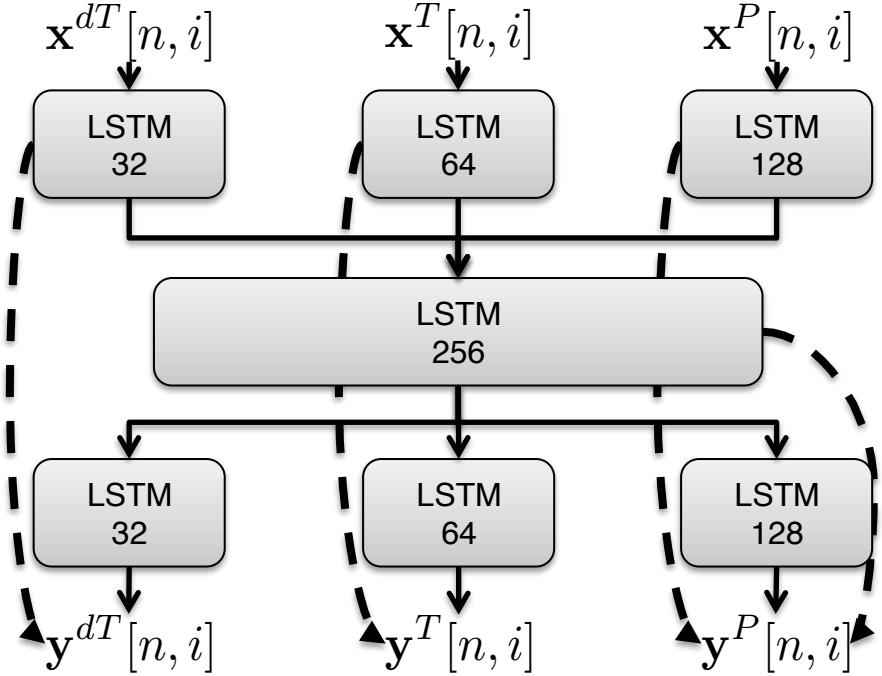
- The space of possible events as a combination of (dT, T, P) is huge (~1e5)

$$Pr(dT[n], T[n], P[n]||\mathbf{note}[1:n]) =$$
$$Pr(dT[n+1]|\mathbf{note}[1:n])\times$$
$$Pr(T[n+1]|\mathbf{note}[1:n], dT[n+1])\times$$
$$Pr(P[n+1]|\mathbf{note}[1:n], T[n+1], dT[n+1])$$

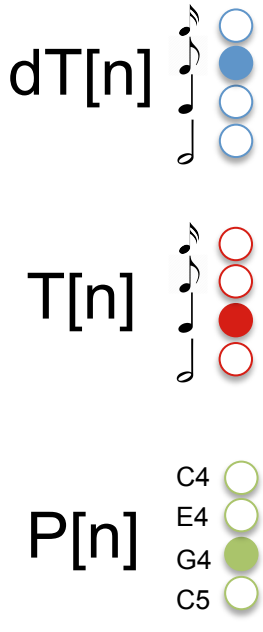
dT	T	P
0	6	21
0	4	24
0	6	28
0	8	33
4	3	36

Network architecture

- 3 LSTM layers
  - 1st and 3rd are feature-dependent
  - 2nd is shared across features
- All feature-dependent layers are connected to their feature's output layer
- The shared layer is connected to the pitch output layer

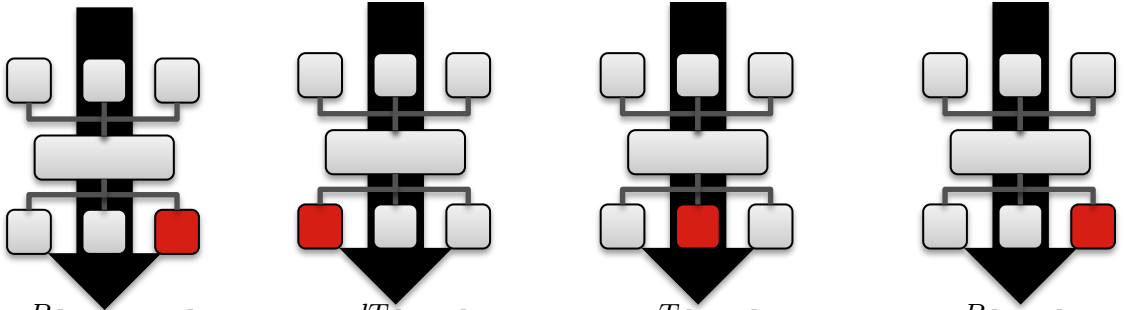


Conditional architecture | Unrolling features in time



$\mathbf{X}[n-1,3]$ $\mathbf{X}[n,1]$ $\mathbf{X}[n,2]$ $\mathbf{X}[n,3]$

$\begin{pmatrix} dT[n] \\ T[n] \\ P[n-1] \end{pmatrix}$ $\begin{pmatrix} dT[n] \\ T[n] \\ P[n] \end{pmatrix}$ $\begin{pmatrix} dT[n+1] \\ T[n] \\ P[n] \end{pmatrix}$ $\begin{pmatrix} dT[n+1] \\ T[n+1] \\ P[n] \end{pmatrix}$



$\mathbf{y}^P[n-1,3]$ $\mathbf{y}^{dT}[n,1]$ $\mathbf{y}^T[n,2]$ $\mathbf{y}^P[n,3]$

$Pr(P[n])$ $Pr(dT[n+1])$ $Pr(T[n+1])$ $Pr(P[n+1])$

Training

Modeling MIDI with RNNs | Miniproject 2

$$Pr(\mathbf{note}_s[1:N_s]) = Pr(\mathbf{note}_s[1]) \prod_{n=1}^{N_s-1} Pr(\mathbf{note}_s[n+1]|\mathbf{note}_s[1:n])$$

- RNNs approximate the transition probability as

$$\mathbf{y}[n] = \Phi(\mathbf{note}[n], \mathbf{H}[n]) \approx Pr(\mathbf{note}[n+1]|\mathbf{note}[1:n])$$

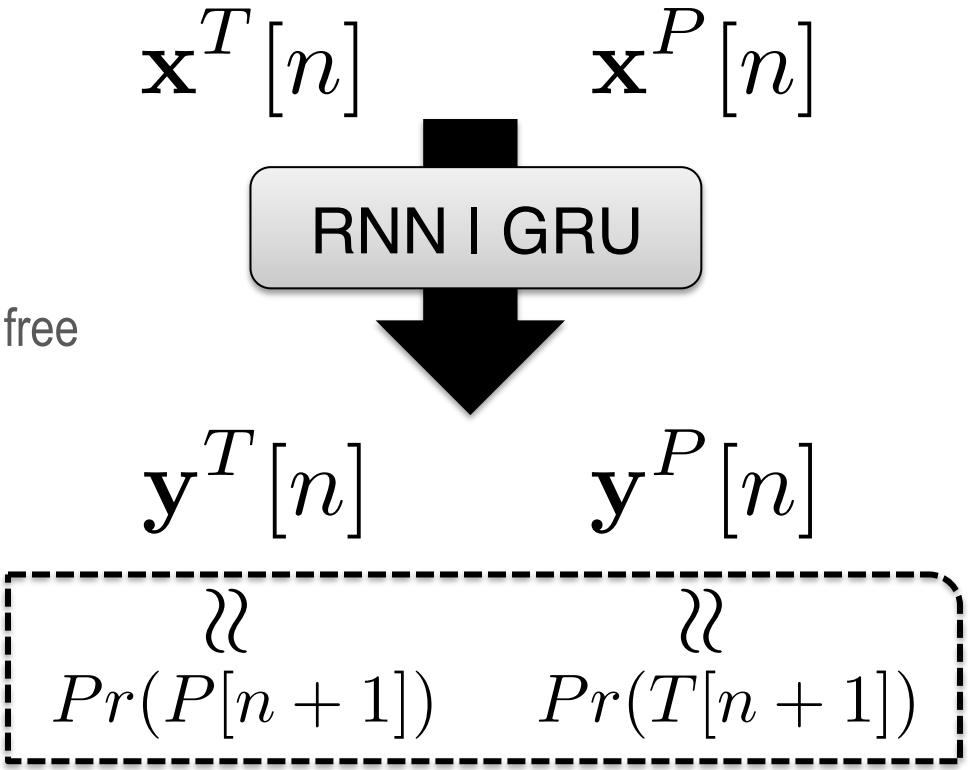
- The space of possible events as a combination of (T, P) is big (~1e3)

$$Pr(T[n], P[n]||\mathbf{note}[1:n]) =$$
$$Pr(T[n+1]|\mathbf{note}[1:n]) \times$$
$$Pr(P[n+1]|\mathbf{note}[1:n])$$

T	P
6	21
4	24
6	28
8	33
3	36

Network architecture | Miniproject 2

- Compare RNN vs GRU
- Hidden layer(s) architecture is free
  - Minimum 128 hidden units



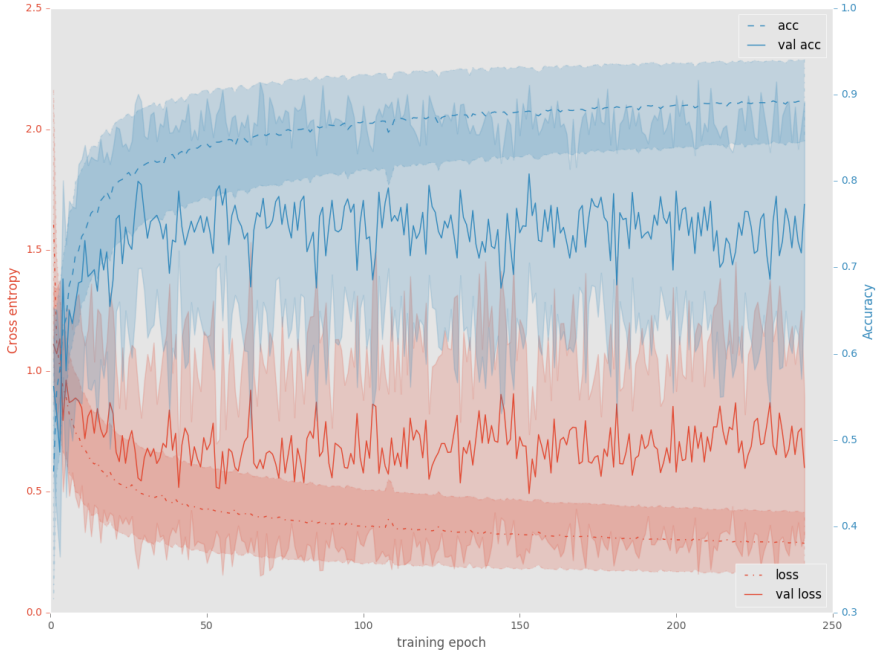
Deep learning techniques

- Multiple layers
  - Having 3 layers of LSTM cells allow for more complexity and broader timescale spectrum yielding better predictive performances
- Shortcut connections
  - Connections between a layer and the output allow the connected layer to learn representations directly (and indirectly) related to the desired output.
- Data augmentation
  - Between each training epoch, randomly transpose each song. Constrain on the possible pitch range
- Regularization
  - Dropout to prevent overfitting
- Masking
  - Allow to handle songs with variable lengths

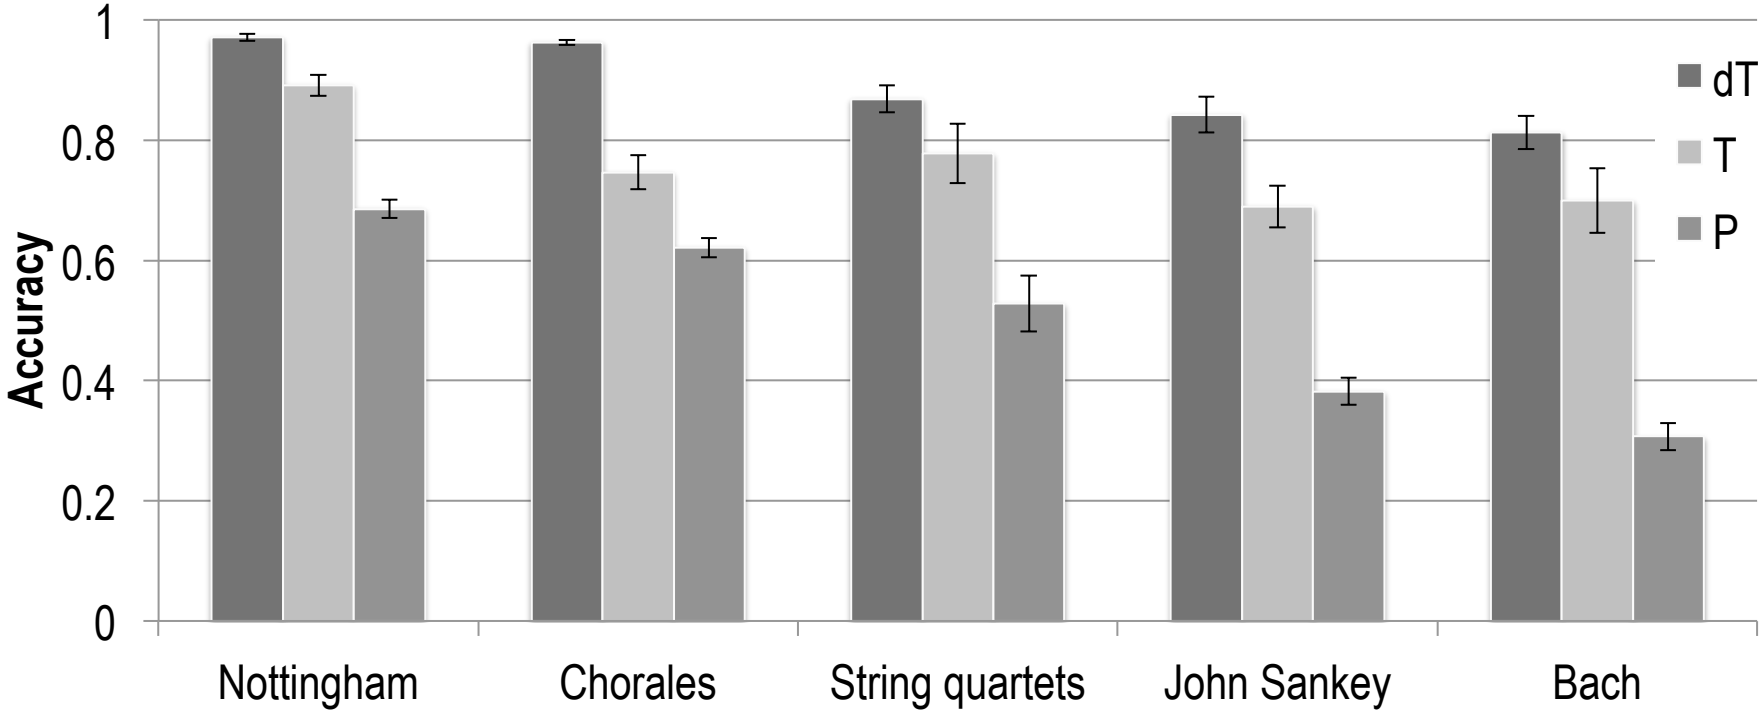
Training the networks

- For epoch and model:
  - Randomly transpose each song in dataset
  - For batch in training data
    - Reset model states
    - S_b → Randomly select batch_size (32) songs
    - X,T → Get the input/target sequences from S_b
    - Cut the X,T sequences in consecutive blocks of N(=50) timesteps
    - For each consecutive block:

      Use BPTT and Adam optimizer to apply the parameters update
  - Evaluate model on validating data
  - Record performance



Trained network performance on validating set



Architecture and training | Summary

- Conditional approach
  - Decrease the input/output dimensions
  - Allow to model the relations between melody and rhythm
- LSTMs ability to operate on multiple timescales allows to reach high performances on many different datasets
- dT > T > P
  - dT[n+1] can often be deduced from T[n] (especially true for monophonic melodies)
  - Rhythm is a more stable feature of music
  - Future works should be focused on improving pitch predictions
- Music with more complex structure is harder to learn
- Heterogeneous datasets are harder to learn

Generating with bachProp

For timestep n in generating song S:

- Sample dT[n+1] from Pr(dT[n+1]) = $Y^{dT}[n,1]$
- Sample T[n+1] from Pr(T[n+1]) = $Y^{T}[n,2]$
- Sample P[n+1] from Pr(P[n+1]) = $Y^{P}[n,3]$
- Add note e[n+1] = (dT[n+1], T[n+1], P[n+1]) to S
